

LinkedIn Post — Danny Driscoll

I built my entire UX portfolio website using AI. Not "AI helped me write copy." I mean Claude designed the architecture, wrote every component, fixed the bugs, did the QA, and deployed it. Here's what that actually looked like.

I've been a UX designer for 18 years. Six case studies — TeleSign, Netflix, Appily.com, and others — all documented with real outcomes, screenshots, and video. The work was done. The portfolio site kept not being done. Every time I tried to build it myself, I'd hit a wall three hours in and bail.

So I tried something different. I used Claude in Cowork mode with a set of MCP plugins — tools that give the AI direct access to my file system, my browser, and a headless testing environment. I briefed it the same way I'd brief a developer: here's the stack (Next.js 14, TypeScript, Tailwind), here's the architecture, here's the content, here are the quality standards. Then I reviewed the output, identified what was wrong, and redirected.

What surprised me most wasn't the speed (though 3 weeks vs. a typical 8-12 week build is significant). It was how much the *design* work still mattered. Claude can execute brilliantly. It cannot decide whether something is right. The information architecture, the component structure, the judgment call about what goes above the fold — that's still entirely a UX designer's job. What changed is the ratio of thinking time to building time. I used to spend 90% of the effort on implementation. Now it's closer to 50/50. More design, faster ships.

The site is live at displayedux.com. Full writeup on the process — including what broke, the MCP workflow, and a reusable template for future client builds — is at [\[BLOG LINK\]](#).

If you're a designer who's been avoiding the technical side, this is the moment to reconsider. You don't need to learn to code. You need to learn to direct.
